

## WART REMOVAL

1. Soak the wart(s) in warm water for about 15 minutes.
2. Using a pumice stone, abrade the wart nightly.
3. Using Vaseline, make a ring around the base of the wart to protect the good skin.
4. Apply a small amount of Salicylic Acid to completely cover the wart.
5. Cover the wart with thick electric duct tape. Using the new decorative duct tape doesn't have the same effect.
6. When the duct tape does not stay adhered to the skin, remove it.
7. Soak the wart and start this routine over again at step #2 above.
8. This may be every night or every few nights depending on how dry and calloused the skin is.
9. Continue this routine until the wart disappears. This may take 3 months or more.
